[TARGET DATA]

LATITUDE: -8.7833

LONGITUDE: 34.5667

CONFIDENCE: 70%

[ANALYSIS]

The persistent 'avoidance zone' and local oral traditions hint at a unique, possibly anomalous location. Matching the 'hill that moves' and 'place where metal sings' descriptions with real-world analogs, the Nguru Mountains in Tanzania could be a candidate. This area is known for its diverse geology, and the presence of rare earth elements could explain the 'anomalous soil composition'. The latitude and longitude provided correspond to the center of the Nguru Mountains.
